The behavior was studied of small quantities of iron in glass; principally by measuring the transmission of glass in ultra violet and infra red, taking into consideration the influence of the socalled "solarization" process. The ferric and the ferrous ions exist in the studied glasses only in the formative positions. The differences found concerning the absorbing influence of the ferric ions in the region of the ultra violets and following changes of the composition of the glass, are (Materials--Ceramics, TT, v. 8, no. 9) (over)
